Virtual Private Cloud (VPC)

多重備援的神奇魔力

講義與實作文件下載處

Virtual Private Cloud (VPC)

VPC is a space on a public cloud that allows you to define a virtual private network where you deploy, secure, control and manage cloud resources dedicated to your business.

VPC is your own space in the cloud

Accelerate non-disruptive cloud adoption and migration with VPCs

IP Address Range

VPCs enable native Bring-Your-own-IP (BYoIP) address range for non-disruptive connectivity of cloud and on-premises resources

Flexible migration of workloads that uses advertised IP address prefixes to the IBM Cloud

Simpler VPCs with bring your own private IP without NAT or Tunnels

Non-disruptive on-premises connectivity without changes to existing networking environments

Keep Traffic flowing from endpoints that use the private IP address through services that utilize IP address reputation

Expand your workload options with VPCs

VPC enables business applications workloads to easily migrate to the cloud, or just burst into the cloud as needed. Availability Zones (AZ) with no shared points of failure keep your workloads available.

VPC is available in **multiple regions with multiple AZs** in each region for higher availability

Allow clients to scale as needed with MZRs without worrying about resources or capacity

Utilize private service endpoints that connect to a number of IBM Public Cloud services

Building blocks of a VPC
